

The release is live.

The field proof is next.

NiyamLens 0.4.4 | Rule pack LMPC-RC-2026.09-RC6

[Open the live NiyamLens website](#)

Do not call this winner-ready yet. The engineering release passes the checks below. Recognition on unfamiliar real packages, time saved and qualified legal/measurement validation remain unproven.

What is fixed and verified

Check	Observed result	Boundary
GitHub verification	603/603 release tests; build, asset integrity and dependency audit passed	Release commit d13aad5
Interrupted upload	Prepare retry recovers already uploaded, unregistered bytes; repeat is idempotent	Actual hosted Auth/Storage
Stale changes	Reviews and assignments return 409; recorded state remains unchanged	Four-function migration rehearsed and applied
Hosted API acceptance	41 authorization + 27 additional checks passed	Four synthetic users / two test workspaces
Hosted Chrome roles	4/4 sign-ins, correct lists, fresh image retrieval and export	Not real participant testing
Hosted disconnected workflow	OCR, offline seal, queued reload, reconnect, one server seal, fresh export passed	OCR ran online first; real session expiry not tested here
Containment	4/4 synthetic memberships disabled; marked evidence retained	No human account or password changed
Public release probes	50 checks passed in 16 snapshots over 15 minutes	Low-volume probes, not maximum-load stress

The recognition result you must disclose

Eight known development photos / ten readable target fields: direct raw recovery 1/10; with automatically selected layout suggestions 5/10. Five remained unresolved. This is AI-provisional development evidence, not blind accuracy. Zero wrong-valid derived readings in this tiny set is not a safety guarantee.

Original image hashes, raw OCR and correction history remain separate. A clipped-date parsing defect and an outward crop-rounding defect were corrected. No OCR gain is claimed from the crop fix.

A short, concrete field plan

1. Collect the declarations, not just the package front

Suggested collector	Assigned IDs	Status
Arif	PKG01-10	Proposed; not collected
Tharun	PKG11-20	Proposed; not collected
Banu	PKG21-30	Proposed; not collected

For each new physical product, capture the full declaration panel, complete MRP heading/value, complete quantity heading/value/unit and manufactured/packed stamp with its heading. Combine only when one original photo already shows multiple declarations; do not collage originals. Keep the physical package.

Include flat, glossy, curved, small-print, faint-stamp and multilingual examples. Preserve originals and source rights. Reserve products by SKU before tuning, for example 10 development and 20 evaluation products. The previous 24 public photos are AI-exposed and contain only 5 readable target slots out of 72; they are not a fresh blind benchmark.

2. Freeze independent answers before testing

Two people independently label each evaluation photo without OCR outputs, catalogue answers or each other's answers. A third person adjudicates disagreements. Record unreadable/not-visible rather than guessing. Freeze source hashes, labels, exclusions and browser modes before the run. AI cannot impersonate either reviewer.

3. Time the entire task, including failures

Proposed pilot: six new users, two physical packages each, both manual and NiyamLens methods, alternating which comes first. Use the supplied `observer.html` timer for capture, reading/OCR wait, corrections, measurement and report/export. Do not pause away waiting or discard failures. Export the JSON after every session.

A different person must physically check each report before any time-saving calculation is accepted. The timer leaves `qualityReview` null. There are no completed human timings in this release.

4. Get qualified review

Send the unsigned domain packet and five complete package reports to a qualified Legal Metrology practitioner. Ask for corrections to applicability, exemptions, typography and evidence sufficiency. Separately compare physical dimensions with independently measured references and documented uncertainty. A teammate account called officer is not government approval.

[Detailed task sheet, timer link and review protocol](#)

Show what happens. Keep the limits visible.

Time	Live action	What to explain
0:00-1:15	Outsider chooses a new package; start Blind Challenge and upload panels	No prepared answer and no hidden fixture substitution
1:15-2:45	Check capture, run actual OCR, open a source-linked reading	A confidence score is not measured accuracy
2:45-4:25	Review fields, applicability and supported physical measurement	Show corrections explicitly; abstain when scope/scale is unresolved
4:25-5:15	Trace two rule findings back to preserved evidence	Deterministic versioned checks; not an AI statutory accusation
5:15-6:35	Finalize, show server acknowledgment and fresh retrieval/export	Local saved, queued and server acknowledged are different states
6:35-7:00	Show the actual outcome and remaining validation gates	Do not force PASS or promise a win

Before the team presents

Rehearse three times with an outsider and keep failed attempts. Include a disconnected-network trial with assets cached. Give every subsystem a primary and backup presenter. Use separately authorized accounts, never shared passwords. Old presentations may contain stale accuracy/test claims; check every number against this release.

Operational limits still open

The retained rollback copy covers four database functions and execute grants only. It is **not** a full workspace, Auth or Storage backup, and no protected off-site disaster-recovery rehearsal was completed. Connected cloud OCR execution and email delivery are not established by this acceptance run. The hosted offline test used a still-valid session and previously completed OCR; expired-session behavior was exercised separately with mocked test identities.

Release trace

Application commit: **d13aad50adedaa2c3a7d1c41bd036fe65bcb5b54**

Deployment: dpl_FPx8WbxZrukoGC3RijjaKiuRbc8q

Public app module: /assets/index-E1tT8IDD.js
